

1Fi SDE Intern Assignment

Objective

The objective of this assignment is to evaluate your ability to understand an existing product, work within an existing codebase/UI, and build a new feature while maintaining consistency with the existing 1Fi app experience.

You are required to build the **1Fi Marketplace** section within the existing **Shop** page of the 1Fi app.

Assignment

1. Explore the 1Fi App

- Download and explore the **1Fi app**.
- Navigate to the **Shop** page.
- Understand the existing UI, navigation, components, and overall user experience before starting the implementation.

2. Add 1Fi Marketplace

Add a new **1Fi Marketplace** section to the Shop page.

The Shop page should have the following three options:

A. Top Brands

- No implementation is required.
- The page can remain blank.

B. Nearby Stores

- No implementation is required.
- The page can remain blank.

C. 1Fi Marketplace

- This section needs to be fully designed and implemented.
 - Follow the requirements and reference screens provided in this assignment document.
 - The UI should be consistent with the existing 1Fi app in terms of layout, typography, spacing, components, navigation, and overall experience.
-

1Fi Marketplace

The Marketplace should allow users to browse products and view relevant product and EMI information.

The implementation should include, where applicable:

- Product listing
- Product image
- Product name
- Product pricing
- Product variants
- EMI options/plans
- Relevant product details
- Ability to select an EMI plan
- CTA to proceed with the selected plan

The exact product/content requirements are provided in the reference material attached to this assignment.

Technical Requirements

Frontend

- Use the existing 1Fi app's technology stack wherever possible.
- Maintain consistency with the existing application architecture and UI components.
- Ensure the implementation is responsive and provides a smooth user experience.

Data & APIs

Where product or EMI information is required:

- Avoid hardcoding data directly into UI components.
- Structure the implementation so that product and EMI data can be retrieved dynamically.
- You may use mock APIs/data sources where backend integration is not available as part of the existing app.

Code Quality

We will evaluate:

- Code structure and readability
 - Component reusability
 - API/data handling
 - State management
 - Error and loading states
 - Responsiveness
 - Overall engineering practices
 - Consistency with the existing 1Fi codebase
-

Evaluation Criteria

The assignment will primarily be evaluated on:

1. **Product understanding** – How well you understand and extend the existing 1Fi experience.
2. **UI/UX consistency** – How closely the new Marketplace experience aligns with the existing 1Fi app.
3. **Engineering quality** – Code structure, reusability, maintainability, and implementation quality.
4. **Functionality** – Completeness and correctness of the Marketplace flow.
5. **Data/API implementation** – Quality of data handling and API integration.
6. **Attention to detail** – Responsiveness, loading/error states, navigation, and overall polish.

Note: You are not expected to redesign the existing 1Fi app. The focus of this assignment is specifically on building the **1Fi Marketplace** section within the existing Shop experience.
